²¹ It is likely that parents do not report their children as working if the number of hours worked is low. As long as this threshold level of hours of work (μ_w) is the same for all households, (5.4) would be simply replaced by $l_w = 1$ if $l_w^* > \mu_w$, 0 otherwise, without affecting the results. However, if some parents deliberately misreport (i.e. they do not report the child to be working even when hours worked by the child is above μ_w), the resulting coefficient estimates are inconsistent (see Hausman *et al.* 1998). Despite its potential relevance, this issue will not be further explored in this paper.

Marginal effects are evaluated at the means of the variables, and represent percentage changes in the relevant probability resulting from a unit increase in the relevant variable (1% increase in the case of credit).
